TITLE: ~~The use of~~ Crystal Diodes with Non-Quadratic Characteristic
for Microwave Measurements

PERIODICAL: Slaboproudý obzor, 1960, Vol 21, Nr 6, p 368

ABSTRACT: The author presents a nomogram for the calculation of
SWR for standing-wave detectors using diodes with other
than quadratic characteristics. The exponent of the
diode characteristic is in the limits 1.5 to 2.8, SWR,
1 to 4 and attenuation 0.3 to 12 dB. There are 2 figures.

TITLE: Measurement of the Attenuation of Coaxial Cables
at Microwave Frequencies

PERIODICAL: Slaboproudý obzor, 1960, Vol. 21, No. 11,
pp. 649 - 651

TEXT: Measurement of the attenuation of coaxial cables at microwave frequencies is not the type of measurement that is often encountered in practice and, in those cases where it is necessary, it is advisable to employ a standard microwave measuring equipment based on a rectangular waveguide and a transformer section connected between the waveguide and the cable. During such measurements it is necessary to determine the characteristic quantities required for the graphical determination of the scattering matrix for the transformer section between the waveguide and the cable (Refs. 1, 8). Determination of the scattering matrix permits evaluation of the reflection coefficient between the transformer section and the cable, provided the reflection coefficient in front of the

Card 1/3

J

23074

Z/039/60/021/011/002/003
E192/E382

Measurement of the Attenuation

transformer section is measured. The reflection coefficient should be determined twice. First, a section of the cable having a length of 0.4 - 0.7 m is connected to the transformer section, the cable being open-circuited at the end; the length of the cable depends on its attenuation. The cable is then shortened by about 8-10 cm and the reflection coefficient between the transformer section and the cable is determined on the basis of the measured coefficient at the input to the transformer section. The attenuation of the cut-off section of the cable can then easily be evaluated from the standard formula which is used in the calculation of the attenuation of waveguides. The graphical calculations for these measurements are performed by means of the Smith chart. Use of the Smith chart for determining the necessary parameters of the scattering matrix is explained and the measuring equipment is briefly described. Also, two simple numerical examples are given. The above method is similar to that employed in the measurement of the waveguide attenuation by means of the standing waves (Ref. 11). However, the error in the

Card 2/3

23074

Measurement of the Attenuation

Z/039/60/021/011/002/003
E192/E382

measurement is of the order of $\pm 8\%$, due to the fact that the reflection coefficient is determined through the transformer quadripole connected between the waveguide and the coaxial cable. The method is also disadvantageous in that the measured section is open-circuited. On the other hand, it has the advantage that it is possible to measure cable sections of any given characteristic impedance.

AUTHOR: Hosek, Jirí

TITLE: Calibration of Variable Microwave Attenuators in
the X-ray Band

PERIODICAL: Slaboproudý obzor, 1961, Vol. 22, No. 3,
pp. 170 - 173

TEXT: The method of calibration described is based on a thermistor bridge and its extension, which is based on the substitution principle and permits calibration up to 60 dB with an error of less than 1%. The procedure during the calibration is as follows. A variable standard attenuator is first measured by means of a thermistor bridge (Ref. 1 - (the author, Slaboproudý obzor, 1959, Vol. 20, No. 7, pp. 419 - 422)). The attenuator is measured at least twice at the same frequency and its calibration curve is taken up to 30 dB. However, in the vicinity of 30 dB it is found that the error is of the order of 1 dB. Consequently, in further measurements it is necessary to use that portion of
Card 1/4

Calibration of

23674
Z/039/61/022/003/006/006
E192/E382

the calibration curve where the spread is less than 0.05 dB. In this way, it is possible to obtain a calibration curve up to 15 dB with an error of ± 0.5 dB. Further calibration is carried out by the substitution method (Ref. 2 - R. Montgomery, Measurement Technique at cm Waves. Russian transl. Moscow, 1949) Now, the attenuator to be calibrated (referred to as A) is calibrated by means of an attenuator, B. The attenuator A is set at 10 dB (this is done by means of the thermistor bridge). A range of 10 dB is then chosen on the attenuator B in such a way that the spread of the measured values is a minimum. This is usually observed between 2-12 dB or between 3-13 dB. Thus, the attenuator B is set at 13 dB and a suitable deflection is observed on the output meter. The setting of the attenuator B is then changed to 3 dB and the deflection of the output meter is adjusted to the previous values by setting the attenuator A. In this way a further attenuation of 10 dB was added to A, so that its total attenuation is 20 dB. This measurement is repeated at least

Card 2/4

23674

Z/039/61/022/003/006/006
E192/E382

Calibration of

four times and the arithmetic mean is taken as the accurate value. In general, the spread of the values is less than 0.1 dB. In the same way, it is possible to calibrate the attenuator up to 60 dB in steps of 10 dB. Similarly, it is possible to calibrate attenuator A by means of another attenuator, C. The three attenuators, A, B and C, can thus be calibrated, each being compared with the other two. In the measurements carried out with three attenuators, it was found that in the vicinity of 60 dB the spread did not exceed 0.25 dB. It is seen, therefore, that the error in calibration was less than $\pm 1\%$ of the measured value. The above method is suitable for frequencies ranging from 8 200 to 12 400 Mc/s. The equipment used in the measurements was the standard waveguide measuring set, furnished with a thermostat and an intermediate frequency amplifier.

794. Hosek, J., Solution of the effect of an opening in a thin shear wall by the method of increments of shear flows from the opening, *Engng. Rev.*, Prague no. 7, 1-11, Feb. 1961.

A method whereby the effect of an opening in a statically indeterminate shear wall, such as thin-walled web girders, can be solved by means of solutions of statically indeterminate systems where the shear wall is replaced by a system of bars or by a

method of increments of the shear flows from the opening. The solution assumes that (a) the walls resist shear stresses, (b) the shear walls do not transmit in-plane bending stresses, and (c) the effect of distortion of struts is neglected.

Only the case of a wall of uniform thicknesses of the same material is solved; however, the calculations may be extended to cases of arbitrary wall thicknesses. C. H. Matthews, USA

TEXT · A transducer based on the measurement of the Hall constant is proposed. It consists of a magnetic circuit and a probe entering the airgap of this circuit. The probe is made of a conductor or semiconductor with a large Hall coefficient. A transducer for measuring the liquid level in vessels is obtained when a magnetic core fixed to a float and forming an element of the magnetic circuit moves and thus affects the magnetic field and the voltage across the probe. For measurement of pressure the probe is connected with a membrane that deforms under pressure and thereby causes a displacement of the probe which at its turn induces a variation in the Hall voltage.

AUTHOR: Hošek, Josef, Doctor, Engineer
TITLE: The sonic boom
PERIODICAL: Letecký obzor, no. 7, 1961, 213-215

TEXT: The article describes the generally known physical laws explaining the cause and nature of the sonic boom and covers the following topics: The effect of the atmosphere-temperature gradient on the shape of the shock wave; the influence of the angle of flight-path inclination and meteorological conditions on the sonic-boom intensity; an explanation of the meaning of the critical Mach number. Sonic boom originates only at supersonic aircraft speeds. The shock waves of a supersonic aircraft jeopardize people and light structures on the ground and, therefore, their intensity on the ground must be reduced to a minimum. This can be accomplished by increasing the flight altitude since the intensity of the sonic boom reaching the ground decreases sharply with increasing altitude of the aircraft. Due to the effect of the atmosphere-temperature gradient,

Card 1/2

Z/040/61/000/007/001/001
D006/D102

The sonic boom

the shock wave bends forward and its energy dissipates more readily into the atmosphere. Sonic-boom intensity increases during descending flight and decreases during climbing. Consequently, supersonic aircraft flying over populated areas should climb and descend below the critical Mach number. There are 5 figures, 1 table, 2 Soviet-bloc and 2 non-Soviet-bloc references. The two references to English language publications read as follows: L. J. Lina, D. J. AUTHOR: Hošek, Josef, Doctor, Engineer
TITLE: What will be the development of air transportation
until 2000
PERIODICAL: Letecký obzor, no. 9, 1961, 302-305

TEXT: This is the first part of a solicited contribution to a survey of expert opinions concerning the trends along which the development of air transportation until 2000 is likely to proceed. In this part the author briefly reviews the development of aviation from the first flight of A. F. Mozhaysky to the space flight of Yuriy Alexeyevich Gagarin, and concludes that the development of aviation to-date has been characterized by a steady increase of speed, altitude and range. However, as the speed of conventional aircraft is raised the take-off and landing speeds also increase demanding ever longer and more expensive runways. Therefore, future development will proceed towards high-speed VTOL aircraft. The current approaches towards achieving VTOL (rotors, tilting wings,

Card 1/2

What will be the ...

Z/040/61/000/009/002/002
D005/D102

tilting propeller or jet engines, jet stream deflection) are only transitional and will be superseded by lifting engines in the course of natural development. From among the existing engine types it is only the bypass engine which holds some promise since it may eventually reach a thrust-to-weight ratio of 15 and a specific fuel consumption as low as 0.2 kg/kg. To achieve optimum economy, however, special light-weight lifting engines will be developed. These, in turn, will be followed by the development of wingless aircraft as they feature optimum aerodynamic, thermodynamic and mechanical properties. The lift for these aircraft will be produced by a battery of light-weight lifting engines suitably arranged around the aircraft's center of gravity. For forward flight, several special dual-purpose thrust-lift engines will take over. The shape of these aircraft will be such as to produce optimum performance in that speed range (subsonic, supersonic or hypersonic) in which a particular type will be used. It will resemble the fuselage of a "flying fortress" or a "flying boxcar" or the conventional aircraft age. Stabilization and control of the aircraft will be effected by gas jets from suitably positioned nozzles. There are 8 figures.

Hošek, Josef, Doctor of Engineering

Dnešní letectví; nové vývojové směry v letectví (Modern Aviation;
New Development Trends in Aviation) Prague, Práce, 1962. 170 p.
(Series: Technický výběr do kapsy, sv. 43). 15,000 copies printed.

Resp. Ed.: Josef Strouhal.

PURPOSE: The book is intended for readers with a basic technical education.

COVERAGE: The present state of aviation and prospective developments in the theory and design of aircraft are discussed. The book explains the basic principles of overcoming gravity in the atmosphere and beyond it and the principles of VTOL aircraft. High-speed aerodynamics (shock waves, aerodynamic heating) is briefly discussed. Modern aircraft engines and rockets are described, their principles explained, and prospective development outlined. No personalities are mentioned. There are 34 references: 18 Czech, 7 English, 5 German, and 4 Soviet.

"Research on Speech in Hypnotic Age Regression."

Prague, Activitas Nervosa Superior, Vol 5, No 1, Jan 68; pp 13-21.

Abstract [English summary modified]: Enunciation of 16 words was compared in children aged 0.5, 1 and 2 years; in adults instructed to pronounce these words as children of these ages; and in 6 adults during hypnotic regression to said ages. Authors conclude that there is no true regression; hypnotized adults seem to overestimate the ability of the children to enunciate the words tested. "Leary's Method of Interpersonal Personality Diagnosis (Attempt to Test the Concept Validity in a Group of Neurotic Patients.)."

Prague, Československá Psychiatrie, Vol 59, No 5, 1963, pp 304-310

Abstract: Leary's method was successfully applied to Czech language and environment. Restandardisation and empirical validation would be valuable. It seems that theoretically it would be more correct to work out a new method of interpersonal diagnosis making full use of Leary's stimulating system as well as of other factors. The model would then be less impressive but would be closer to the multidimensional socio-psychological reality. 3 Figures, 2 Tables, 3 Western references.

Testing of zinc coating of wires. B. Hoskna. *Elektrotech. Obsor.* 12, 211 51(1948). —The Preece and salt-spray tests have disadvantages. Removal of the Zn layer chemically and weighing the Zn so obtained is a method that is being used. This led to the development of the H test, in which the developed H is measured and from this the Zn quantity calculated. A soln. of 40 g. H_2SO_4 per l. water and a light gasoline, alc-ether, or some similar soln. is used for grease removal. The app. enables detn. of the thickness and the quality of the Zn layer. If the layer thickness only is of interest it is merely necessary to measure the total quantity of the developed H in the test

tube after the bubble generation on the wire surface has stopped completely. If it is desired to test the quality of the Zn layer as well, readings of the developed H have to be taken every min. till no more than 0.1-0.2 cu. cm. of H is generated per min. The curve obtained gives a clear indication of the quality of the Zn layer and repetitive tests give nearly the same results (curves are plotted). It is also possible to distinguish between galvanically coated wires and those which are heat-treated, because the characteristic curves differ greatly for the 2 types of coating. Generally the quality of the coating is the better the longer the relative time for soln. of $\frac{1}{2}$ of the Zn coating compared to the soln. time of the whole Zn layer. The disadvantage of this test arrangement is that a new soln. of the same concn. is required for each test; also the test process is very slow. These disadvantages are eliminated

in the testing app. of Keller and Boháček, which is briefly described. HCl is used, with an addn. of 10 cc. $SnCl_4$ as a protective medium. The development of H starts immediately after the sample is dropped into the test tube and is terminated in 1-3 min., depending on the soln. of the soln. The soln. can be used several times, and when it is said, with Zn fresh soln. is filled into the test tube. Tables are compiled enabling quick calcn. of the wt. of the Zn layer per sq. m. for various wire diams. and H quantities. Abrogement charts are also available for quick calcn. of the wt. of the Zn layer. Very accurate results are obtained with this method and comparison with results obtained by weighing showed a difference of only 1.15%. While the quantity of Zn in the coating is accurately detd. by this method, the uniformity of the coating is not. It is contemplated to include this method in the Czech standard specification ESC 481, and H recommends the H test for straight wire, and random tests for wires taken from wire ropes, for which random submersion tests should also be made.

TITLE: Experimental studies of the relation between the current of ionization chamber and the radiation intensity frequency

SOURCE: Jaderna energie, no. 2, 1965, 62-63

TOPIC TAGS: ionization, ion chamber, radioactivity

ABSTRACT: The experimental verification of the amplitude dependence of the ionization current on the modulation frequency, which was predicted is described. This dependence can be a source of error with measuring equipment with which modulation of the radiation is used. At least qualitative agreement of the experimental results with the theoretical calculations is shown. The calculation of the correction was not carried out because the required parameters were unknown. Curves are given showing the change of ionization current with chambers filled with nitrogen and with air. With nitrogen the current decreases up to a frequency of about 400 cycles per minute and then is nearly constant. With air-filling the curve shows definite maxima and minima. Orig. art. has: 1 graph, 2 figures.

"Low Pressure Chambers."

Prague, Radar, Vol 1, No 3, Nov 66, pp 28 - 31

Abstract: The importance of low pressure chambers in aeronautical and space medicine is discussed. Classification and applications of low pressure chambers are discussed. Construction principles of low pressure chambers are discussed. Equipment and instrumentation required for the operation of these chambers are described. Use of these chambers in medical treatment of certain diseases, and their use in training of personnel for flying duties is evaluated. Chambers designed for explosive decompression are described. Communication tunnels between the chambers and the outside are described. Principles of medical observation of personnel remaining in low pressure chambers are discussed. Details of the low pressure chambers produced by the Czech firm CKD are presented. 6 Figures, no references.

"Dynamics of Some Physiological Parameters During Overpressure - Respiration in People with Good Tolerance of Intrapulmonary Oxygen Overpressure."

Prague, Pracovni Lekarstvi, Vol 18, No 2, March 66, pp 54 - 56

Abstract [Authors' English summary modified]: Some physiological functions were investigated at overpressures of 33 to 74 torr. The overpressure was compensated by a special suit. The pulse rate increases with increasing overpressure; with the wearing of the overpressure suit, the increase is limited. The ECG showed symptoms of vegetative irritability; no signs of overloading of the right heart or ischaemia of the myocardium were found. There was considerable temporary respirational arrhythmia; blood pressure increased. 4 Figures, 6 Western, 1 Russian reference. (Manuscript received 5 Nov 64).

"Dynamics of Some Physiological Parameters During Overpressure. - Respiration in People with Poor Tolerance of Intrapulmonary Overpressure."

Prague, Pracovni Lekarstvi, Vol 18, No 2, March 66, pp 57 - 60

Abstract [Authors' English summary modified]: Criteria of insufficient adaptability of the organism to oxygen respiration with intrapulmonary overpressure were determined. These criteria may be applied also to people with low overpressure tolerance. In people with a lower overpressure tolerance the pulse rate increases, decreases or oscillates during respiration. In most cases the oscillation of the isoelectric plane of the standard ECG leads is enlarged, and the synchronization of the breath and respiration arrhythmia disappear. A progressive decrease of the blood pressure is an early symptom of the imminent collapse. 6 Figures, 8 Western, 2 Czech, 1 Russian reference. (Manuscript received 5 Nov 64).

Jan Hospodář, M. D.

Člověk v meziplanetárním prostoru (Man in Interplanetary Space) Prague,
Orbis, 1960. 217 p. 20,000 copies printed. (Series: Malá moderní
encyklopedie, sv. 19)

Resp. Ed.: Vladimír Špinka, Engineer

PURPOSE: This popular-style book is intended for the general reader.

COVERAGE: The book is based mainly on Soviet data and presents the physical
aspects of outer space from the biological point of view. Attention is
given to the effect of space factors on the body and methods and equipment
for human flight in outer space are described. Details of the first experi-
ment with the dog Layka in space flight are given. Return to the Earth, the
selection and training of astronauts, scientific results of space flights,

and space medicine are treated. No personalities are mentioned. There are 7 references, all Czech.

TABLE OF CONTENTS:

Introduction	5
Outer Space From the Biological Point of View	
Subdivision of space; its boundaries	9
Characteristics of atmosphere and vacuum	15
Effect of radiation on the body	23
Conditions of life in space beyond the Earth	32
Effect of Space Flight on the Body	
Flight characteristics	50
Effect of change in weight	57
Effect of other flight factors	71
Effect of escape velocities on the body	81
Psychological problems of space flight	92
